1. Flock Automatic License Plate Readers (ALPRs) work by (1) taking a picture of every vehicle (2) using AI software to record the make, color, number of occupants, driver, bumper stickers, state of disrepair, and more, and then (3) uploading it to a national database with over 90,000 connected cameras--accessible by countless law enforcement officers without a warrant. ALPR Scans are also obtainable via a public record request.

2. Moore confirmed that Chesterfield plans to purchase multiple Flock drones, which track people as well as cars, for use in our parks as well as the Chesterfield Valley. He supports these plans.
